

# Construction Projects

The Construction Projects module is a great method for tracking the many categories and costs associated with construction.

The Construction Project Master offers a chance to record the projected cost of each category and sub-classification on a time line basis. The actual to date plus any remaining future projected cost compared to the budget offers valuable variance information.

Featuring a category and sub-classifications for each construction project to record budgeted and actual cost. For example, if the category was building foundation then the subs might be clearing the land, digging the hole, footings, framing and pouring, blocks, etc.

An accounting of the budget and actual cost for each GL or Construction Master is available at any time for comparison. Variances are summarized and reported.

A month-by-month audit trail is also available in Accounts Payable as a result of the construction designation. The Construction Projects are also easily purged at completion.

## Reports

- Construction F/Y Summary
- Construction Project Report
- Construction Projections
